

Task 30 - End of tests

Report creation date: 09.02.2023

Name of the tested application: <https://warsawsneakerstore.com/>

Author: Paweł Kurzydło

In the last lesson of the course, I consider testing to be completed. One of the most important aspects is that all areas that should have been checked have been tested and are working properly, while also meeting business criteria.

The defects found have been reported, and reports on the progress of the application testing have been prepared. Another issue is the deadline. Despite slight delays in checking tasks by the trainer, I managed to meet the deadlines and complete all the tasks assigned to me.

As for tasks that I would still perform, it would definitely be to review the application and perform additional exploratory tests to ensure the quality of the software before delivering it to the client.

If the time for testing has ended, and we cannot perform any more tests, I would discuss the product with the management to draw conclusions from the project's progress and be more prepared for the next project after analyzing them.

Regarding going through the testing process again, I would not change my approach to testing. At the beginning of the course, finding any defect in a functioning application seemed daunting and impossible to me. However, one of the principles of testing is that there is no defect-free software. Therefore, using the skills that I acquired during the course, determination, curiosity, and the desire to break something, I proved that the application has defects in extreme cases.

Instead, I would like to focus more on improving some reports in which the trainer pointed out the writing style and focus more on the diversity of testing to avoid repetition and focus on improving their quality to maintain a good level in the first project.

After completing the course, I plan to review all the tasks I sent and create a file listing the weaknesses, including notes from emails from the trainer.

The course itself has given me a lot, it is very substantial, and it is broken down into first principles in such a way that the tester can consolidate good habits while working in this position. For the development of hard skills, it was also a significant contribution that will make me feel more confident during future recruitment interviews for my first job. As for areas where I feel strong, it will certainly be a focus on the most critical aspects of the application that are a priority but unfortunately, it is at the expense of less important areas such as a blog. However, the defects that I am most satisfied with are, of course, the requests that have been a nuisance for the duration of the course, and the defect that I did not report, which could have been critical, as I think about it from a time perspective. If a user enters incorrect login data several times in a row, they will receive a ban on their IP, which is signed with the following message:

Error 1106

Ray ID: 796d9b16a88dbf42 • 2023-02-09 15:23:22 UTC

Access denied

What happened?

The owner of this website (warsawsneakerstore.com) has banned your IP address (2a01:112f:50d:4700:61c3:b469:dcea:77f7).

Not reporting this issue was probably caused by me finding it quite late. I would just like to add that if developers add a time-based lockout feature after three unsuccessful login attempts, the problem should disappear.

Summing up the course, I am really satisfied with what I have learned from it because it met my expectations completely. I wanted to turn theory into practice and I believe I did it well as a beginner tester.
