

Task 5 - Finding functional defects. Analyzing the correctness of function's operation and discovering irregularities.

Name of the tested application: Warsaw Sneaker Store

Report creation date: 02.12.2022

Author: Paweł Kurzydło

ID: 001

Name: Incorrect product categorization on the website

Description: After clicking on a particular category, the website displays products from a different category.

Category: Functional

Priority: Low

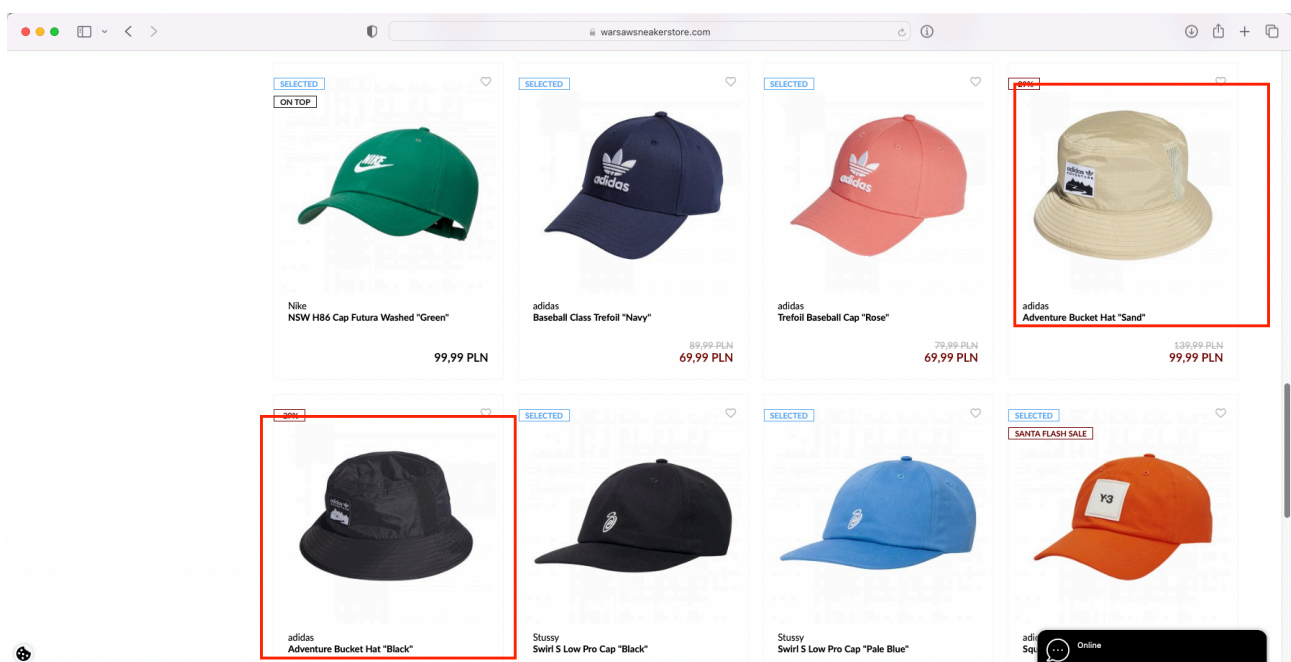

Current Result: When clicking on the "Baseball Caps" category, products from the "Hats" category are displayed.

Expected Result: The website should only display products that match the selected category.

Steps to Reproduce:

1. Open the application <https://warsawsneakerstore.com>
2. From the navigation menu, select "Accessories"
3. Then, in the Categories section, select "Baseball Caps"
4. Scroll down to the bottom of the product list.

Environment: <https://warsawsneakerstore.com>, macOS Monterey 12.6, Safari 16.0 (17614.1.25.9.10, 17614)

While searching for bugs, I analyzed functionalities such as Cart, Filtering, Favorites, and also tested the calendar, but due to not wanting to replicate errors from the previous task, I dismissed the idea of reporting them in this lesson.

I also reviewed the blog, but ultimately, the categorization of products on the website caught my attention.

The only thing that I have doubts about is the severity of this defect. I believe it is not critical because it does not significantly affect the application's process execution. However, if we click on any of the aforementioned products, we will see that it is assigned to the "Hats" category by default, so I definitely consider it a defect.
